

Cert-manager

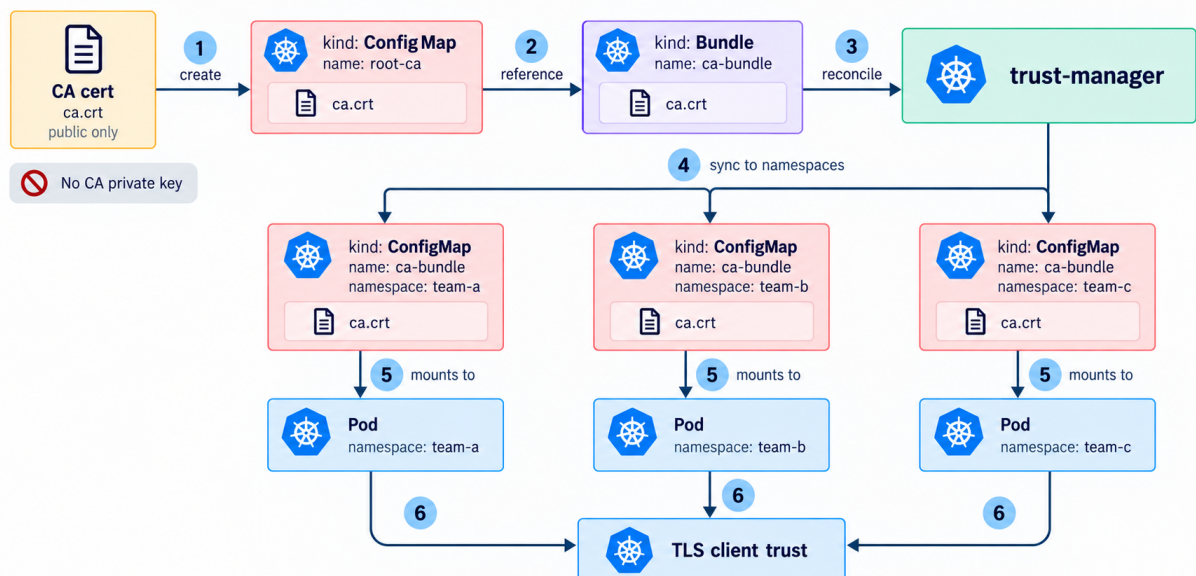

- It helps to:

1. Set issuer
2. Auto create cert from gateway request
3. Save in kubernetes secret with defined name in gateway.

* Only when gateway wants to reference a Secret in another namespace, Reference Grant is needed.

Trust-manager

- A kubernetes controller who distribute private CA bundle to pod across namespaces for client pod to trust the system.
- Mostly use for Private PKI (Public Key Infrastructure) [CA/Vault]
- ★ CA.crt, not gateway's tls.crt [If not, need to update trust by gateway's tls.crt everytime recreate server]

Role

ConfigMap (root-ca) : Source of trusted CA cert

Bundle : Declare which CA to trust and where to distribute

ca-Bundle: Generated bundle in target namespace
